Car theft has been a persisting issue around the world and the issue comes mainly from educated and high skills thieves. In this project a vehicle security system is presented to protect and disable an automobile and inform the owner about what had been happened to his/her car. It hence decreases thieves from committing their job. It also effectively monitors any disaster that may occur inside the car by means of many sensors such as: Temperature, Humidity, Car Location ...etc. The details of system design and implementation are described in the report. The experimental results show that our system is feasible and the owner can secure his vehicle within a few seconds via automatic notifications via the cellular data interface short messaging system.
